

Final reflection

Problem 1:

The first Azure cognitive resources specific problem has occurred with the Azure Video Indexer. It was not possible to access and work with the Video Indexer from my local development environment. When I tried, an SSL error was always displayed.

The problem could be solved by processing all tasks in which the Video Indexer was used in the exercise or Project Jupyter notebooks provided. Here the Video Indexer could be used as learned in the lecture.

Problem 2:

The second problem occurred during the training of the custom vision service for lighter detection. The wrong Azure resource was selected during the first attempt, since there was only a training resource available and no prediction resource.

The problem was solved by creating a new project for the lighter detection and selecting the correct resource in this project. This allowed training and prediction to be carried out.
